

Project Responsibilities

Task	Responsibility
Perform Data Analysis	Seyi
Clean Data	Seyi
Encode Data	Seyi
Normalize	Aisha
Assess Importance of Features	Aisha
Implement Model 1	Zack
Implement Model 2	Dharmik
Accuracy Metrics of Model 1	Cesar
Accuracy Metrics of Model 2	Cesar
Report on effect of data pre-processing, encoding, normalizing Model 1	Zack/Seyi/Aisha
Report on effect of data pre-processing, encoding, normalizing Model 2	Dharmik/Seyi/Aisha
Git Hub administration	Zack

Our team consists of five members namely, Zack, Seyi, Dharmik, Cesar and Ayesha and responsibilities were clearly divided based on the tasks as shown in the table above. Seyi handled the initial data analysis, cleaning and encoding. Ayesha focused on normalization and assessing of feature importance. Zack implemented Model 1(Logistic Regression) and managed GitHub repository. Dharmik implemented Model 2(Random Forest). Cesar calculated and compared the accuracy metrics for both models.

Although tasks were assigned individually, all members contributed to reviewing the code, validating results, and refining the documentation. We met in person multiple times to discuss model performance and interpretation of results. In addition, we conducted group calls to resolve implementation questions and ensure consistency between preprocessing steps and modelling.

Everyone actively participated in analysing features and outputs, interpreting feature importance, and reviewing each other's sections before finalizing the code and report. Collaboration between all the members was smooth, and responsibilities were respected while maintaining open communication throughout the project.
